

What is 3003 aluminum made of?

That strip of metal is made up of 3003 aluminum--one of the most versatile grades of aluminum featured across a wide variety of applications. Part of the 3xxx series of aluminum, the primary alloying element in 3003 aluminum is manganese. In the case of 3003 aluminum, the amount of manganese ranges from 1-2%.

How strong is alloy 3003?

Alloy 3003 is fairly low strength, but it can be hardened to a significant degree by cold working, enabling a series of "H" tempers. Alloy 3003 is also produced as a bright finish treadplate (also known as chequer plate) with industrial and decorative applications.

What tensile strength is 3003 aluminum?

This provides a high level of tensile strength (also referred to as ultimate strength, it is the maximum conventional stress that a steel can withstand). In fact, its tensile strength is in the range of 17 to 30 KSI. 3003 aluminum has excellent workability, weldability, and corrosion resistance, and conforms to AMS QQ-A-250/2 and ASTM B209.

Is alloy 3003 hardenable by heat treatment?

Alloy 3003 is not hardenable by heat treatment. It can be significantly hardened by cold work (e.g. by cold rolling) and various "H" tempers are produced - most commonly H12 (1/4 Hard) and H14 (1/2 Hard) - as well as the soft annealed Temper O condition.

What tempers can be used in 3003?

Specialist tempers such as F, H112 and the H2x range are also possible in 3003 - refer to standards for details. These comparisons are approximate only. The list is intended as a comparison of functionally similar materials not as a schedule of contractual equivalents.

Rexton Steel & Alloys inc is leading manufacturers, exporters, suppliers of Aluminium Alloy 3003 Round Bars, 3003 Aluminium Alloy, 3003 Aluminum Round Bar, Aluminium Alloy 3003 Hex ...

At present, fossil fuels are the steel sector's bloodstream: 27 EJ (10 18 J) of coal, 3 EJ of gas and 5 EJ (1400 TWh) of electricity are consumed annually for the production of the ...

The inside radius of the bend should not exceed "2d" for mild steel bars and "3d" for high - yield bars ("d" being bar diameter). Too tight a radius will break weaken the bar. ...

The 3003 features a quick-handling 69° head angle, a steep 74.5° seat angle to shift weight forward, medium long frame Reach, comfortably high (but not extreme) Stack, lots of BB drop, and short for a cruiser 420mm ...

Nordest calls it a flat bar gravel bike, but it doesn't really have to be a flat bar only. In fact, the 3003 Ti (like the steel version) sits as a happy medium between the lighter ...
