

What are the applications of aerogels in energy conversion and storage devices?

Therefore, the application of aerogels to energy conversion and storage devices is summarized in three major categories inorganic, organic and composite aerogels. The high surface area and porosity of inorganic oxide aerogels are beneficial for adsorption which is crucial for dye-sensitized solar cells and supercapacitors.

What are aerogels used for?

Aerogels are highly porous networks of nanoparticles that have long been prized for their exceptionally high surface area. However, their use in electrochemical energy storage devices (EESDs) did not begin until the development of carbon aerogels (CAs) in the late 1980s.

Are aerogel nanostructures sustainable?

Certainly, aerogel nanostructures are sustainable materials for the fabrication of energy conversion and storage devices. Li, K., Lin, B.: Impacts of urbanization and industrialization on energy consumption/CO<sub>2</sub> emissions: Does the level of development matter?

Can biomass aerogels be used for energy storage?

We review the research on the energy storage applications of various biomass aerogels based on cellulose, hemicellulose, lignin, and polysaccharides in recent years. Biomass feedstocks are characterized by their diverse sources and low costs.

Can aerogel nanostructures be used for dye-sensitized solar cells?

Therefore, this review describes on the applications of inorganic, organic and composite aerogel nanostructures to dye-sensitized solar cells, fuel cells, batteries and supercapacitors accompanied by the significant steps involved in the synthesis, mechanism of network formation and various drying techniques.

Why are aerogel nanostructures used in space applications?

Aerogels were employed as particle detectors and cosmic dust collectors in space applications due to their extraordinarily low refractive index. They have the lowest thermal conductivities of all solids which make this material as a best thermal insulator. The above applications of aerogel nanostructures were reviewed well by Lawrence.
