

Are electric vehicles a good option for the energy transition?

Our estimates are generally conservative and offer a lower bound of future opportunities. Renewable energy and electric vehicles will be required for the energy transition, but the global electric vehicle battery capacity available for grid storage is not constrained.

Which EV batteries are used for vehicular energy storage applications?

Moreover, advanced LA, NiCd, NiMH, NiH₂, Zn-Air, Na-S, and Na-NiCl₂ batteries are applied for vehicular energy storage applications in certain cases because of their attractive features in specific properties. Table 1. Typical characteristics of EV batteries.

Are energy storage devices a problem?

The energy storage device is the main problem in the development of all types of EVs. In the recent years, lots of research has been done to promise better energy and power densities. But not any of the energy storage devices alone has a set of combinations of features: high energy and power densities, low manufacturing cost, and long life cycle.

Are EVs more energy efficient than water storage systems?

However, the energy density of such systems is three times higher than that of a sensible storage system with water. In EVs, the automatic thermoelectric generation system, which converts waste heat into electrical energy, can be potentially used to optimize overall efficiency and fuel cost.

Should automotive OEMs adopt a circular economy solution?

Automotive OEMs should acquire or collaborate with companies providing circular economy solutions and battery manufacturers. Standardization in terms of battery type, circularity by design and EoL/ End-of-Use information will be key here to the smooth implementation of new CBMs that accommodate the uptake of EVs.

Should EV batteries be used as stationary storage?

Low participation rates of 12%-43% are needed to provide short-term grid storage demand globally. Participation rates fall below 10% if half of EV batteries at end-of-vehicle-life are used as stationary storage. Short-term grid storage demand could be met as early as 2030 across most regions.
