

Can energy storage technologies help a cost-effective electricity system decarbonization?

Other work has indicated that energy storage technologies with longer storage durations, lower energy storage capacity costs and the ability to decouple power and energy capacity scaling could enable cost-effective electricity system decarbonization with all energy supplied by VRE 8,9,10.

How will energy storage help meet global decarbonization goals?

To meet ambitious global decarbonization goals, electricity system planning and operations will change fundamentally. With increasing reliance on variable renewable energy resources, energy storage is likely to play a critical accompanying role to help balance generation and consumption patterns.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Why is capacity expansion modelling important in energy-system decarbonization?

As grid planners, non-profit organizations, non-governmental organizations, policy makers, regulators and other key stakeholders commonly use capacity expansion modelling to inform energy policy and investment decisions, it is crucial that these processes capture the value of energy storage in energy-system decarbonization.

How can LDES solutions meet large-scale energy storage requirements?

Large-scale energy storage requirements can be met by LDES solutions thanks to projects like the Bath County Pumped Storage Station, and the versatility of technologies like CAES and flow batteries to suit a range of use cases emphasizes the value of flexibility in LDES applications.

Can thermal storage solve the intermittent nature of solar energy?

Spain's Andasol Solar Power Station With its molten salt thermal storage system, the CSP project can produce power for up to 7.5 h following dusk. Its storage system demonstrates the possibility of thermal storage to solve the intermittent nature of solar energy by enabling a more consistent and stable supply of solar electricity.
