

What is an accumulator station?

Accumulator stations: Intended for use in hydraulic systems consisting of a diaphragm or bladder-type accumulator with shut-off block on mounting elements. The following models are available:

What is a hydraulic accumulator?

A hydraulic accumulator is a pressure storage reservoir that stores hydraulic fluid under pressure, often using compressed gas. Key components include the shell, bladder/diaphragm, and gas pre-charge. Accumulators store energy in the form of hydraulic fluid, releasing it when needed to maintain pressure or deliver additional power to the system.

What accumulators does Bosch Rexroth offer?

Bosch Rexroth offers a range of bladder and diaphragm accumulators to meet the requirements of all system sizes and applications. Their models are specialised to provide customers with long product life cycles and sophisticated options. In summary, the range of Bosch Rexroth hydraulic accumulators follows below.

What are the different types of hydraulic accumulators?

Serve as buffers, absorbing pressure surges and ensuring consistent system performance. Bladder Accumulators: Most common in mobile and industrial hydraulics, offering rapid response to pressure changes. Diaphragm Accumulators: Compact and cost-effective, ideal for lower volume and pressure applications.

Who makes hydraulic accumulators?

At BSP Hydraulics, we supply accumulators from manufacturers such as Hydro Leduc and Parker. The most common types of hydraulic accumulators are piston, diaphragm and bladder types.

What is a piston accumulator?

Piston accumulators use moveable pistons to separate the two sections. They are often used for heavy-duty applications with high flow rates. The design does make them more sensitive to contamination which can cause damage, but most types of piston accumulators can be repaired by replacing the piston seals.
