

What is a fixed gear bike?

A fixed-gear, or fixie, is a bike with a direct link between the rear cog and the rear wheel. This means that when the bike is moving, the pedals are also moving with it, so there's no coasting. In other words, your feet move as long as the bike does.

Is a fixed gear bike better than a freewheel bike?

The build and design of a fixed gear bike offer some notable benefits that you can't get with freewheel bikes. With a fixed gear, the bike uses both momentum and your physical pedaling with a fixed gear to maintain its speed.

How does a fixed-gear bike work?

Since fixed-gear bikes don't have a freewheel mechanism, the rider must constantly pedal to move the bike forward. This means that the rider's energy is used more efficiently, with less wasted energy compared to traditional bikes.

Are fixed gear bikes worth it?

Fixed gear enthusiasts swear by the bikes and view them as superior travel, especially for getting around heavily urban areas. They claim that after getting used to the bikes and learning how to ride them properly, you can get much more out of each ride, along with more control.

Does a fixed gear bike have a hub?

The hub and cog are not connected. Fixed gear bikes have one speed as well, but as we've already said, there is no coasting. Both have one speed, but both offer very different feels and pedalling types. Fixed gear drivetrains would not be ideal for cruiser bikes or BMX bikes.

Why should you choose a fixed-gear bike?

Fixed-gear bikes have a longer lifespan compared to traditional bikes, as they are more durable and require less maintenance. This means that they generate less waste over time, with fewer parts that need to be replaced or discarded. Riding a fixed-gear bike promotes a sustainable and eco-friendly lifestyle.
