

Can graphene be used in energy storage/generation devices?

We present a review of the current literature concerning the electrochemical application of graphene in energy storage/generation devices, starting with its use as a super-capacitor through to applications in batteries and fuel cells, depicting graphene's utilisation in this technologically important field.

How does graphene affect energy storage?

Graphene acts as a conductive scaffold, providing pathways for electrons and enhancing the battery's overall energy storage capacity. This advancement can pave the way for lighter and more powerful energy storage systems in various industries.

Are graphene composites suitable for energy storage applications?

As capacity requirements in energy storage applications increase, graphene composites such as the embedment/encapsulation of nanostructured materials in graphene have been developed to meet these requirements.

Are graphene films a viable energy storage device?

Graphene films are particularly promising in electrochemical energy-storage devices that already use film electrodes. Graphene batteries and supercapacitors can become viable if graphene films can equal or surpass current carbon electrodes in terms of cost, ease of processing and performance.

What is graphene & why is it important?

By leveraging graphene's unique properties, researchers are developing cathode structures that facilitate efficient oxygen reduction and evolution reactions. This enables Li-air batteries to store significantly more energy, making them ideal for applications such as electric vehicles and renewable energy storage systems.

Is graphene a good electrode for energy storage?

Both strategies have achieved notable improvements in energy density while preserving power density. Graphene is a promising carbon material for use as an electrode in electrochemical energy storage devices due to its stable physical structure, large specific surface area ( $\sim 2600 \text{ m}^2 \text{ g}^{-1}$ ), and excellent electrical conductivity.

Unlike graphite, graphene ( $< 10$  atomic layers of carbon) has a surface area of  $2630 \text{ m}^2/\text{g}$ , which allows it to hold Li ions on both faces of the sheet, including its edges, substantially improving the battery's ability to store ...
