How can energy be stored?

Energy can also be stored by making fuelssuch as hydrogen,which can be burned when energy is most needed. Pumped hydroelectricity,the most common form of large-scale energy storage,uses excess energy to pump water uphill,then releases the water later to turn a turbine and make electricity.

Why do we need energy storage?

As the cost of solar and wind power has in many places dropped below fossil fuels,the need for cheap and abundant energy storage has become a key challenge for building an energy system that does not emit greenhouse gases or contribute to climate change.

What is energy storage?

Watch the Stanford course lecture. Find out where to explore beyond our site. Energy storage allows energy to be saved for use at a later time. Energy can be stored in many forms,including chemical (piles of coal or biomass),potential (pumped hydropower),and electrochemical (battery).
