

Can cylinders be stored at a welding/cutting area?

Both storage options -- separation and fire wall -- will usually require an employer to set up a storage area some distance from the welding/cutting area. This means that cylinders will usually have to be transported from the welding/cutting area to the storage area in order to meet the storage requirements.

How do you replace a gas cylinder on a forklift?

Tag them for repair and store them safely. Lift the replacement cylinder into position using a proper lifting technique. Adjust the cylinder until it is properly aligned with the positioning pin to ensure the pressure relief valve is orientated correctly. Secure the cylinder to the forklift. Connect the fuel supply hose to the cylinder.

What should you not do with LPG cylinders on a forklift?

Do not drag, drop, roll or slide the cylinder or allow it to bang against other objects. Do not use matches or a flame to check for leaks. Use soap or a leak detector. Do not mount more LPG cylinders on the forklift than the truck was designed to hold. Do not smoke when handling the cylinder or in the storage area.

How do you store a propane cylinder in a forklift?

Make sure the valve is closed tightly. Store the cylinder outside, in an upright position, in a forklift propane tank holder where it can be secured and is protected from being struck. Put the cylinder down gently. Do not drop, dent or damage. Always protect the valve from any damage. Avoid contact with liquid propane, as it can cause frostbite.

Are propane forklifts safe?

This is especially true for propane forklifts. These models require diligent propane forklift safety. Many have made propane their forklift fuel of choice because it is safe, effective, and can be used both indoors and outdoors with proper ventilation. However, not many people are as well-versed on propane tank safety as they should be.

What should you not do with a forklift?

Do not operate forklifts that appear to have incomplete or improper repairs to the fuel system. Do not use metal tools when changing a cylinder. Do not use excessive force when opening or closing the valve. Do not let the cylinder get too hot or be exposed to excessive heat.
