A similiar test was done with 18650 lithium ion battery where it retained 78.9% capacity at 0 Celsius, -20 Celsius test with LIB was not done as it will most likely damage the LIB. Update: the test by the first reviewer is not done correctly, these sodium ion batteries should only charge at temperatures higher than -10C.

Now that sodium ion batteries are increasingly commercially available (and heck, some cars have already been released that use them), I see 2024 being the "year of the sodium ion battery." I think we'll see more and more EVs announced this coming year that use that chemistry, and a lot more news & buzz about the tech as a whole.
