

What materials are needed for light-duty EV batteries?

We assess the global material demand for light-duty EV batteries for Li, Ni, and Co, as well as for manganese (Mn), aluminum (Al), copper (Cu), graphite, and silicon (Si) (for model details, see Supplementary Fig. 1).

Can car batteries be recycled?

Processes for recovering raw materials from small lithium-ion batteries, such as those in cell phones, are in part already being implemented. However, vehicle batteries are much larger, heavier and more powerful, which makes industrializing the recycling process more complex.

How are EV batteries supplied?

In the model, Co is supplied through three routes: primary Co (p) and reused (u) and recycled (r) EV batteries. Annual primary Co supply is based on the difference between Co demand in t and secondary supply. Secondary supply is calculated on the basis of the total outflow of batteries in time t (equation (2)):

What materials are used to make a battery?

The individual parts are shredded to form granulate and this is then dried. The process produces aluminum, copper and plastics and, most importantly, a black powdery mixture that contains the essential battery raw materials: lithium, nickel, manganese, cobalt and graphite.

Can EV batteries be recycled?

Battery- and carmakers are already spending billions of dollars on reducing the costs of manufacturing and recycling electric-vehicle (EV) batteries -- spurred in part by government incentives and the expectation of forthcoming regulations. National research funders have also founded centres to study better ways to make and recycle batteries.

How can a battery be sustainable?

To achieve sustainability, batteries must operate beyond their current capabilities in terms of longevity, reliability, and safety. In addition, the chemicals and materials used in the battery must be cost-effective while achieving large-scale production.

Automotive lithium-ion (Li-ion) battery demand increased by about 65% to 550 GWh in 2022, from about 330 GWh in 2021, primarily as a result of growth in electric passenger car sales, with new registrations increasing by 55% in 2022 ...
