

Can shock absorbers be used for energy harvesting and vehicle dynamics?

In the literature, researchers performed analyses of energy harvesting and vehicle dynamics by replacing conventional shock absorbers with RSA. The RSA can be installed for energy regeneration in all on-road vehicles; however, the amount of energy harvested depends on road conditions and vehicles.

Can regenerative shock absorbers reduce fuel consumption?

Converting vibration energy from suspension systems and shock absorbers into electric energy has great potential, effectively reducing the fuel consumption of vehicles. In addition, the research status of regenerative shock absorber structures was summarised and analysed.

Can energy harvesting shock absorbers be used in regenerative suspensions?

Regenerative suspensions with the energy harvesting shock absorber have gained tremendous attention in the past two decades as promising directions in vehicle research because of its potential to enable the suspension system not only providing enhanced dynamic performance but also converting the wasted vibration energy to electricity.

Can regenerative shock absorbers extend the battery endurance of an EV?

Whereas existing regenerative shock absorbers mainly focus on the methods of energy harvesting, there is no such regenerative shock absorber for use in extended range EVs. In this paper, we present a novel high-efficiency energy regenerative shock absorber using supercapacitors that is applied to extend the battery endurance of an EV.

How does a hydraulic shock absorber work?

The conventional hydraulic shock absorber is responsible for absorbing vibration energy caused by uneven road excitations and maintaining the vehicle's comfort and handling. Simultaneously, the vibration energy is wasted in the form of heat to the environment. RSA may transform vibration energy into electrical energy for later use.

Are hydraulic shock absorbers suitable for heavy vehicles?

Hydraulic RSAs are suitable for heavy vehicles and can be installed instead of all conventional shock absorbers with a standard generator module. However, hydraulic RSA has a low energy harvesting efficiency and higher energy losses in the hydraulic circuits.
