

Dihydrogen (H₂), commonly named "hydrogen", is increasingly recognised as a clean and reliable energy vector for decarbonisation and defossilisation by various sectors. The global hydrogen ...

IEA analysis has repeatedly shown that a broad portfolio of clean energy technologies will be needed to decarbonise all parts of the economy. Batteries and hydrogen-producing electrolyzers stand out as two important ...

The individual steps of this catalytic carbon capture and usage (CCU) approach also provide the basis for chemical hydrogen batteries. Here, specifically the reversible CO₂ /formic acid (or bicarbonate/formate salts) system is ...

MITEI's three-year Future of Energy Storage study explored the role that energy storage can play in fighting climate change and in the global adoption of clean energy grids. Replacing fossil ...

In recent years, novel nanostructured hydrogen storage materials have been emerging that exhibit attractive properties in terms of cycling stability, hydrogen storage density, operating temperature, and adsorption/dehydrogenation ...

1 INTRODUCTION. Hydrogen is a clean, high-energy density, and renewable energy source that is expected to help mankind move away from fossil energy. 1-4 At present, widely-used hydrogen storage technologies include compressed ...

In a study published in Journal of Power Sources, researchers from Tokyo Tech have now proposed an alternative electric energy storage system that utilizes carbon (C) as an energy source instead of hydrogen. The ...

There is an intensive effort to develop stationary energy storage technologies. Now, Yi Cui and colleagues develop a Mn-H battery that functions with redox couples of ...
