

When should a CE strategy be applied to a Lib or PV module?

A CE strategy must be applied to the LIB or PV module or the materials used to create it once they have entered the LIB or PV manufacturing process or in the design phase. (See the SI section S3.2.3 for elaboration of examples of this criterion). The research cannot focus solely on LIBs or PV cells built into consumer products.

Should we implement a CE for Lib & PV?

Ultimately, our recommendations from this critical review could inform and complement recent governmental action plans (U.S. Department of Energy 2022) to implement a CE for LIB and PV and be applied to other similar products as the world seeks to reduce material impacts of technology transitions.

Does energy storage need C&S?

Energy storage has made massive gains in adoption in the United States and globally, exceeding a gigawatt of battery-based ESSs added over the last decade. While a lack of C&S for energy storage remains a barrier to even higher adoption, advances have been made and efforts continue to fill remaining gaps in codes and standards.

How can ce Strategies be used in the use phase of LIBS?

Various CE strategies can be employed in the use phase of LIBs, helping to preserve LIB functionality, extend product lifetime, and avoid recycling steps that degrade the product into constituent materials.

How do gaps in energy storage C&S affect the cost of energy storage?

At the bottom line, gaps in energy storage C&S increase the cost (the "-" net cost portion of the graph in Fig. 6) and time needed to deploy energy storage projects, while also limiting the scale of viable projects.

Is energy storage a future power grid?

For the past decade, industry, utilities, regulators, and the U.S. Department of Energy (DOE) have viewed energy storage as an important element of future power grids, and that as technology matures and costs decline, adoption will increase.
