

What are high-pressure gaseous hydrogen storage containers?

This study introduced several high-pressure gaseous hydrogen storage containers, including high-pressure hydrogen storage cylinders, high-pressure composite hydrogen storage tanks, and glass hydrogen storage containers. High-pressure hydrogen storage cylinders include all-metal gas cylinders and fiber composite material-wound gas cylinders.

What is a high-pressure hydrogen storage cylinder?

High-pressure hydrogen storage cylinders include all-metal gas cylinders and fiber composite material-wound gas cylinders. The only commercially available high-pressure hydrogen storage container has the advantages of easy hydrogen release and high hydrogen concentration.

Are CPVs suitable for high-pressure hydrogen storage?

In most of the cases, they rely on the carbon fibers and the resin to fully seal the tank; therefore, these CPVs are among several pressure vessel solutions in consideration for high-pressure hydrogen storage, particularly in vehicles where the weight savings are considerable [20, 33].

How can hydrogen be stored in a pressure vessel?

A common method for storing hydrogen to meet these requirements is within carbon fibre composite pressure vessels. The high strength of carbon fibre allows for the construction of lightweight tanks with gravimetric storage densities of more than four times that of a steel vessel.

Which type of pressure vessel should be used for hydrogen storage?

For the same reason, Type III and IV pressure vessels are preferential to be used in tube trailers and integrated into containers to transport hydrogen. As for low-pressure stationary hydrogen storage at refuelling stations, there is increasing interest in using Type IV vessels.

What is a glass hydrogen storage container?

The glass hydrogen storage containers included hollow glass microspheres and a capillary glass array. This was a new type of high-pressure hydrogen storage container that had the advantages of high mass and volume density, good safety, low-cost parameters, and did not undergo hydrogen embrittlement.
