

MIT engineers developed the new energy storage technology--a new type of concrete--based on two ancient materials: cement, which has been used for thousands of years, and carbon black, a black...

Share this article:By Michael Matz Concrete has been used widely since Roman times, with a track record of providing cheap, durable material for structures ranging from the Colosseum to the Hoover Dam. Now it ...

Thermal energy storage (TES) allows the existing mismatch between supply and demand in energy systems to be overcome. Considering temperatures above 150 °C, there ...

A third approach utilises gravity energy storage. Concrete blocks weighing up to 35 metric tonnes are lifted using excess electricity to store energy as gravitational potential ...

MIT engineers have created a "supercapacitor" made of ancient, abundant materials, that can store large amounts of energy. Made of just cement, water, and carbon black (which resembles powdered charcoal), the device ...

The performance of a 2.5 MWh thermal energy storage (TES) technology has been tested at the Masdar Institute Solar Platform (MISP) at temperatures up to 380 °C ...

"This puts us into a new space for energy storage at prices accessible anywhere in the world." ... For structural concrete, the researchers found they could add up to 10% carbon black without compromising too much ...

MIT engineers created a carbon-cement supercapacitor that can store large amounts of energy. Made of just cement, water, and carbon black, the device could form the basis for inexpensive systems that store intermittently ...

Researchers at MIT continue to look for ways to turn concrete into a perfect energy storage option. The researchers first shared their findings in 2023, suggesting that concrete could be ...

The MIT team says a 1,589-cu-ft (45 m³) block of nanocarbon black-doped concrete will store around 10 kWh of electricity - enough to cover around a third of the power consumption of the average...

Constructed from cement, carbon black, and water, the device holds the potential to offer affordable and scalable energy storage for renewable energy sources. Two of humanity's most ubiquitous historical materials, ...

Thermal energy storage (TES) allows the existing mismatch between supply and demand in energy systems to

be overcome. Considering temperatures above 150 °C, there are major potential benefits for applications, ...
