This review also discusses the charge storage mechanisms of 2D copper-based materials by various advanced characterization techniques. The review with a perspective of the current challenges and research outlook of such 2D copper-based materials for high-performance energy storage and conversion applications is concluded.

Why do we need copper?

Copper is fundamental to renewable energy infrastructure, energy storage systems, and EVs. Rapid urbanization, especially in emerging economies, needs more infrastructure. Infrastructure (incl. energy grids), transportation, and smart cities require lots of copper. More 5G networks; Internet of Things (IoT) devices; other advanced technologies.

Why is the copper supply gap widening?

Several factors are driving the widening of the gap (Table 1). Quicker transition significantly raises demand for copper. Copper is fundamental to renewable energy infrastructure, energy storage systems, and EVs. Rapid urbanization, especially in emerging economies, needs more infrastructure.

How is copper processed?

Copper is routinely processed by common manufacturing methods and it is available in many forms and alloys that can be produced efficiently. Copper adapts to net-shape processing techniques. Some copper products can be semi-fabricated using the "upstream" electrowinning step in copper cathode production.

How does the copper industry benefit from pre-competitive research?

promotion organizations³, the industry funds pre-competitive research leading to the creation of significant new applications for copper. Typical applications for investment include research focused on finding new ways copper can be used to reduce energy consumption.
