

Should rail vehicles have onboard energy storage systems?

However, the last decade saw an increasing interest in rail vehicles with onboard energy storage systems (OESSs) for improved energy efficiency and potential catenary-free operation. These vehicles can minimize costs by reducing maintenance and installation requirements of the electrified infrastructure.

How much energy does a hybrid storage system use?

The total weight of the hybrid storage system is 1646 kg, resulting in specific energy and power of 11.45 Wh/kg and 226 W/kg, respectively. The storage solution demonstrates effective energy savings and wireless operation capability up to 2.5 km.

Will energy storage technologies become technologically mature in the upcoming decade?

These energy storage technologies have the potential to become technologically mature in the upcoming decade. On their side, emerging semi-conductor technologies and novel converter topologies can play a vital role in this process thanks to the reductions in mass and volume that they can achieve.

Are alternative energy sources on board rail vehicles a viable solution?

From a system-level perspective, the integration of alternative energy sources on board rail vehicles has become a popular solution among rolling stock manufacturers. Surveys are made of many recent realizations of multimodal rail vehicles with onboard electrochemical batteries, supercapacitors, and hydrogen fuel cell systems.

What is energy management strategy in multimodal rail vehicles?

In multimodal rail vehicles, multiple energy sources enable several different architectures of the propulsion system. On the other hand, many possibilities arise for the energy management strategy (EMS), which controls the power flows among OESSs during vehicle operation.

Can resonant power transmission be used as a long-range energy storage solution?

On the other hand, innovative paradigms for the supply system, such as inductive power transfer technology, will unfold alternative solutions to onboard energy storage for long-range wireless operation of rail vehicles. Magnetic resonant power transmission has already been tested on scales of hundreds of metres with promising results.
