What are the performance parameters of energy storage capacity?

Our findings show that energy storage capacity cost and discharge efficiencyare the most important performance parameters. Charge/discharge capacity cost and charge efficiency play secondary roles. Energy capacity costs must be $\leq US$ kWh -1 to reduce electricity costs by $\geq 10\%$.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

How does energy storage affect marginal prices?

This large variability in marginal price decreases energy storage is added to the grid since energy storage shifts the costs of generation during periods of peak demand to periods of low demand. For example, with 20 TWh of storage, 99% of marginal prices drop below 130 \$/MWh and only 32% of marginal prices are still at 0 \$/MWh.

Do energy storage mandates reduce variability in electricity prices?

We find that energy storage mandates largely reduce the variability in electricity prices, especially for the first 20 TWh of mandates (Fig. 6a). In the 1.94 TWh baseline, 82% of the marginal prices are at 0 \$/MWh since for large portions of the year the WECC generates more renewable energy than it needs.
