## SOLAR PRO. Distributed energy storage on-site consumption

Why should we review distributed energy storage configuration?

This review can provide a reference value for the state-of the-art development and future research and innovation direction for energy storage configuration, expanding the application scenarios of distributed energy storage and optimizing the application effect of distributed energy storage in the power system.

How can energy storage devices improve on-site energy consumption?

Author to whom correspondence should be addressed. Configuring energy storage devices can effectively improve the on-site consumption rate of new energy such as wind power and photovoltaic, and alleviate the planning and construction pressure of external power grids on grid-connected operation of new energy.

Why is distributed energy storage important?

Moreover, distributed energy storage is also a solution to the costly infrastructure construction of delayed power systems, and it plays a key role in improving energy efficiency and reducing carbon emissions, gradually becoming an important mainstay for the development of distributed generation, smart grid and microgrid [8,9,10].

What are the key issues in the optimal configuration of distributed energy storage?

The key issues in the optimal configuration of distributed energy storage are the selection of location, capacity allocation and operation strategy.

Should energy storage systems be integrated in a distribution network?

Introducing energy storage systems (ESSs) in the network provide another possible approach to solve the above problems by stabilizing voltage and frequency. Therefore, it is essential to allocate distributed ESSs optimally on the distribution network to fully exploit their advantages.

How to cope with the future participation of energy storage systems?

In order to cope with the future participation of a large number of energy storage systems in the power market, the research should focus on the aggregated management of distributed energy storage, the way to participate in peak scheduling and the exploration of demand-side energy storage to participate in power grid operation. 3.
