Can Seoul achieve energy transition in the water sector?

Although Seoul is at the very initial stage (energy production using renewables was 0.131% at raw water purification facilities and 51.6% in wastewater treatment facilities in 2015), its case shows a path for a city to pursue energy transition in the water sector.

#### What is thermal energy storage?

Thermal energy storage is used particularly in buildings and industrial processes. It involves storing excess energy- typically surplus energy from renewable sources, or waste heat - to be used later for heating, cooling or power generation. Liquids - such as water - or solid material - such as sand or rocks - can store thermal energy.

#### Are all thermal power plants seawater cooled?

In the case of China, 50% of all the thermal power plants located within 20 km of the coastline are even within 0.49 km. Therefore, all the thermal power plants in China located within 0.49 km from the coastline were assigned as seawater cooled. All other thermal power plants were assumed to use freshwater for cooling purposes.

#### What are examples of thermal energy storage systems?

Liquids - such as water - or solid material - such as sand or rocks - can store thermal energy. Chemical reactions or changes in materials can also be used to store and release thermal energy. Water tanks in buildingsare simple examples of thermal energy storage systems.

## Does South Korea have a nuclear power plant?

South Korea placed a heavy emphasis on nuclear power generation. The country's first nuclear power plant, the Kori Number One located near Pusan, which opened in 1977. Eight plants operated in 1987, with yearly nuclear power generation at an estimated 39,314 gigawatt-hours, or 53.3% of total electric power output.

## Is PHS a seasonal energy and water storage alternative?

Given the current costs reduction in other technologies offering daily energy storage (particularly batteries),PHS is anticipated to gain importance as a seasonal energy and water storage alternative. A SPHS plant consists of a high-head variation storage reservoir built in parallel to a major river.
