Are lithium ion batteries a cost-effective strategy for decarbonizing power systems?

Sepulveda et al. 1 demonstrated that relying only on lithium ion (Li-ion) batteries (or other storage options with similar characteristics) to augment VRE capacity is nota cost-effective strategy for decarbonizing power systems.

What is the energy density of a lithium ion battery?

Early LIBs exhibited around two-fold energy density (200 WhL -1) compared to other contemporary energy storage systems such as Nickel-Cadmium (Ni Cd) and Nickel-Metal Hydride (Ni-MH) batteries .

What are lithium ion batteries?

Lithium-ion batteries (LIBs) have nowadays become outstanding rechargeable energy storage devices with rapidly expanding fields of applications due to convenient features like high energy density, high power density, long life cycle and not having memory effect.

Do li-ion batteries affect discharge power capacity investments?

A comparable, fixed operations and maintenance (O&M) cost from Li-ion batteries was assumed to be associated with the discharge power capacity investments of LDES. Self-discharge losses and system degradation for LDES systems and Li-ion batteries were not modelled in this work.

Why is Li a good battery material?

Afterward,Li was considered as a battery material because of its' outstanding properties such as low density,high specific capacity, and low redox potentials. Some primary LIBs were available in the market since the late 1960s after the solubility of Li had been examined in a non-aqueous solution by Harris.

What are the applications of lithium-ion batteries?

The applications of lithium-ion batteries (LIBs) have been widespread including electric vehicles (EVs) and hybridelectric vehicles (HEVs)because of their lucrative characteristics such as high energy density,long cycle life,environmental friendliness,high power density,low self-discharge,and the absence of memory effect [,,].
