Edge computing in the energy storage field

What is the research work of energy-aware edge computing architecture?

In this section, we survey the research work of energy-aware edge computing architecture, including memory system, networking, compiler and programmability & reconfiguration, benchmarking and software defined storage. The surveyed work of energy awareness in edge computing system architecture is listed in Fig. 3 and Table 4. Fig. 3.

Is edge computing energy efficient?

Although energy efficiency in cloud data centers has been broadly investigated,energy efficiency in edge computing is largely left uninvestigateddue to the complicated interactions between edge devices,edge servers,and cloud data centers.

What is edge computing?

Networking for energy efficient routing and naming Edge computing brings computing and storage resources closer to the data source,and may perform the computation on the edge nodes of the data source and in the cloud data center. Computing and communications may be invoked back and forth on the edge nodes and cloud data centers.

What is edge computing environment?

In edge computing environment,data storage and computation are performed on edge devices. Unlike cloud servers equipped with high storage capacity and stable infrastructure,edge devices are usually constrained by storage capacity and exposed to unstable environments.

Does increasing energy consumption affect edge computing?

In many edge computing scenarios increasing the energy consumption could have a negative impacton the power-constrained IoT device or edge cloud side with limited power sources. Since billions of edge devices are deployed in edge computing environment,their total energy consumptions are immense and as important as those of cloud data centers.

What is energy aware edge computing?

Although the energy aware edge computing is investigated in various aspects and application domain, most of the existing work focuses on a single objective, such as low latency, data privacy, power saving, or energy efficiency.

To solve this problem, Xu et al. (2021) introduced an adaptive evolution energy control algorithm based on edge computing and mutation strategy to trade-off between load, cost, timing, and other metrics aimed at ...
