SOLAR PRO. Electric car energy storage cooling pipe

Are heat pipes suitable for battery thermal management system of electric vehicles?

The purpose of this study is to understand the suitability of various types of heat pipes for the battery thermal management system of electric vehicles. Heat pipes are the most effective methods for transferring heat, or thermal energy, from one location to another. These two-phase cooling systems are commonly utilized to cool objects or spaces.

Can a heat pipe cool an electric car?

These two-phase cooling sys-tems are commonly utilized to cool objects or spaces. As far as the battery thermal management system of an electric car is concerned, the heat pipe can be employed as a pas-sive cooling technique, although little study has been done on heat pipes up until now.

Can a heat pipe be used as a passive cooling system?

As far as the battery thermal management system of an electric car is concerned, the heat pipe can be employed as a passive cooling technique, although little study has been done on heat pipes up until now. This article provides a thorough review of heat pipe-based thermal management technologies.

Which cooling methods are more suitable for battery electric vehicle applications?

Finally, in terms of thermal management, the study concludes that liquid and phase change material (PCM) cooling methods are more suitable for battery electric vehicle (BEV) applications .

How much cooling power does a small eV have?

For the LCA in this work, it was calculated with 50 heat pipes, which results in a total cooling power of up to 5 kW. This is enough for a small EV to allow for multiple fast charging. Figure 4. Thermal management concept based on thermal switch. The cooling performance of the passive cooling plate depends on the airflow caused by driving.

What is the function of EV cooling system?

The function of the system is the cooling of the batteryof an EV of a compact class type. The functional unit is the mileage of the vehicle, which is assumed to be 150,000 km. The results are related to this functional unit, unless otherwise stated.

The following heat pipe cooling strategies were used: i) horizontal fans, ii) an instantaneous fan, iii) cooling heat pipes with a thermostat tub, iv) hot water cooling pipes, and ...
