

Can a liquid piston based compressed air energy storage system improve utilization performance?

These gaps and challenges motivate researchers to investigate the potential of incorporating the liquid piston-based compressed air energy storage system with a hydraulic PTO system to enhance the utilization performance of a wave energy conversion system. This paper proposes a novel wave-driven compressed air energy storage (W-CAES) system.

What is a wave-driven compressed air energy storage system?

This paper proposes a novel wave-driven compressed air energy storage (W-CAES) system. This system integrates a WEC based on a hydraulic PTO component and a liquid-piston-based compressed air energy storage system to convert wave energy and store it directly as compressed air.

Does compression air cylinder volume variation affect energy storage power?

The compression air cylinder volume variation had a minor impact on the energy storage power and energy storage efficiency. Energy storage power increased at a reduced rate as the storage pressure increased, owing to the increased hydraulic resistance in the wave energy converter caused by high storage pressures.

How does storage pressure affect energy storage power?

It was observed that as storage pressure increased, the energy storage power initially increased quickly and then gradually increased to a maximum value. However, with the high polytropic index, the increase in energy storage power with the storage pressure was slow.

What is the energy storage power of a W-CAES system?

It was seen that the energy storage power of the proposed W-CAES system with the same geometry dimensions was larger than that of the 10 kW combined with the heaving buoy prototype in the literature when wave energy was  $<15$  kW.

Is the energy storage power of a prototype adiabatic?

Therefore, it is discerned that the energy storage power of the prototype closely approximates the result achieved by the W-CAES model under the assumption of  $n = 1.4$ , in which the compression process is adiabatic. However, the actual compression process largely depends on the water flow rate.
