

Are conductive bulk molding compounds a viable solution for bipolar plates?

Corrosion is a major issue in bipolar plates given the environment it lives in, but LyondellBasell has a viable solution. Unlike traditional materials such as metals which contribute to the corrosion issue, conductive bulk molding compounds (BMC) from LyondellBasell have excellent corrosion resistance, enabling durability for longer life.

Can BMC be used to make bipolar plates?

Cho et al. [2] used the bulk molding compound (BMC) process in composite graphite to produce bipolar plates with a graphite-polymer proportion of 9:1. They found that bipolar plates made with BMC are more electric resistant than those made from injection molding.

Are large-scale battery storage facilities a solution to energy storage?

Large-scale battery storage facilities are increasingly being used as a solution to the problem of energy storage. The Internet of Things (IoT)-connected digitalized battery storage solutions are able to store and dynamically distribute energy as needed, either locally or from a centralized distribution hub.

Are bipolar plates a key component of PEMFC?

Bipolar plates are a key component of PEMFCs as they account for significant fractions of their weight and cost. To increase the corrosion resistance and interfacial contact resistance of the PMMA bipolar plates, surface modification was systematically used in their preparation.

What is mechanical energy storage?

Mechanical energy storage harnesses motion or gravity to store electricity. For example, a flywheel is a rotating mechanical device that is used to store rotational energy that can be called up instantaneously.
