What is sensible heat storage (SHS)?

TES systems primarily store sensible and latent heat. Sensible heat storage (SHS) involves heating a solid or liquid to store thermal energy, considering specific heat and temperature variations during phase change processes.

Why is latent heat storage better than sensible heat storage?

Due to the isothermal nature of the process, latent heat storage has a couple of advantages over sensible storage. It stores a high amount of heat with only a slight temperature variation resulting in 5-10 times higher thermal storage density than the sensible heat storage.

Which heat storage mechanisms are used in passive building systems?

TES designs in building applications. Among three heat storage mechanisms, only sensible and latent heat storage are implemented in passive building systems, as shown in Fig. 7. In this regard, the energy is stored or released using materials with high thermal mass (active) and phase change materials (passive).

What is the difference between energy storage and passive heating?

For water heating, energy storage as sensible heat of stored water is logical. If air-heating collectors are used, storage in sensible or latent heat effects in particulate storage units is indicated, such as sensible heat in a pebble-bed heat exchanger. In passive heating, storage is provided as sensible heat in building the elements.

What is thermochemical heat storage?

Thermochemical heat storage can be applied to residential and commercial systems based on the operating temperature for heating and cooling purposes. It works based on converting heat into the chemical potential energy through reversible reactions, storing/releasing heat in/from a thermochemical material.

Are heat storage processes isobaric or non-isometric?

Most of the sensible heat storage processes, particularly those using solid materials, can be regarded as isobaric. Due to thermal expansion, the majority thermal energy storage processes are non-isometric. Isothermal processes occur during the phase change of latent heat storage systems and the storage step.
