

Can gravity energy storage improve the performance of a hoisting system?

This paper investigates an innovative energy storage concept which combines gravity energy storage (GES) with a hoisting device based on a wire rope with an aim to enhance the system performance. A sizing method was performed to determine the proper sizing of the hoisting system's components, mainly the wire rope and the drum.

Can a wire rope hoisting device improve the performance of gravity energy storage system?

This paper has investigated the idea of improving the performance of gravity energy storage system by the addition of a wire rope hoisting device to support the lifting of the piston. First of all, the appropriate size of the hoisting system's components was first determined. The type of the rope and the required safety factor were identified.

How does an additional hoisting system work?

The additional hoisting system is composed of a wire rope and a drum connected to a motor/generator. To store energy, both the pump-motor and the drum motor use excess electricity to make the piston move in an upward motion.

Are there different dry gravity storage methods based on hoisting methods?

In the same context, two different dry gravity storage based on hoisting methods was also proposed by Botha et al., namely the traditional drum winder hoist, and the ropeless hoisting method. This latter relies on the concept of a linear electric machine as hoist.

What is gravity energy storage system modeling?

Gravity energy storage system modeling The amount of energy stored and discharged from GES system depends on the container height and diameter, as well as the piston height and its relative density (with ρ). In storage mode, the pump motor consumes energy to raise the heavy piston.

What is the energy capacity of GESH without a hoisting system?

Finally, the energy capacity of GESH has been found equal to 0.43 kWh; this is almost the double of the energy capacity of GES without a hoisting system. To validate the developed model, the experimental prototype developed by the University of Innsbruck has been used in this case study.

One of these gravitational energy storage methods, involving moving a solid mass vertically up and down, is further analysed in terms of energy storage capacity, energy and power density ...

The article presents the numerical investigation of the overhead crane's energy consumption. The analysis is based on the hybrid model of the crane consisting of numerical model of drive ...

of the hoisting motor and slewing motor, will greatly cut down the energy consumption and production cost of the shovel [1]. To recycle and utilize the gravitational and potential energy ...

energy storage technology faces are introduced, so that the reader can know what to ... More recent energy storage methods, like electrical ESS, are the goal of Chap. 4. In this chapter, ...

Europe and China are leading the installation of new pumped storage capacity - fuelled by the motion of water. Batteries are now being built at grid-scale in countries including ...
