

What is demand-side energy management (DSM)?

Demand-side management, a new development in smart grid technology, has enabled communication between energy suppliers and consumers. Demand side energy management (DSM) reduces the cost of energy acquisition and the associated penalties by continuously monitoring energy use and managing appliance schedules.

What is energy demand management?

It encompasses the management of energy after the meter and includes all the measures that can be taken by the consumer and actions of demand decrease, demand response, and market strategies form the basis of energy demand management.

Why do utility companies need a demand management system?

Utility companies offer an increasing number of options for demand management and educate the public about them. Regulatory support, financial incentives, and new technologies are limiting issues for the implementation of energy demand management. Most of the consumed energy in the world is powered through the electricity distribution grid.
