

Can domestic energy storage facilitate demand response?

The aim is to enable energy storage at consumer premises to not only take advantage of lower wholesale energy prices, but also to support low voltage (LV) distribution networks for reducing network investment. New operation strategies for domestic energy storage to facilitate demand response (DR) are developed in the paper.

Do demand response resources and energy storage systems provide additional benefits?

However, the demand response resources and energy storage systems do not necessarily guarantee additional benefits based on the applied period when both are operated simultaneously, i.e., if the energy storage system is used only to increase the performance reliability of demand response resources, the benefit decreases.

Can home-area energy storage facilitate demand response?

New operation strategies for domestic energy storage to facilitate demand response (DR) are developed in the paper. They have the capability to maximize the overall savings in energy costs and investment costs. In the proposed approach, the operation of home-area energy storage devices is jointly conducted by end customers and network operators.

How to maximize the benefits of energy storage systems?

Thus, to maximize the benefits via an energy storage system with multiple purposes (demand response, electricity sales, peak shaving, etc.), we must allocate the proper output (charging and discharging energy) for each purpose.

Is ESS a stable resource on the demand side?

However, the power usage plan of the end-user cannot completely guarantee the performance reliability upon the reduction request, and hybrid operation with ESS with high control flexibility has been highlighted as a measure of improving its value as a stable resource on the demand side [2,3].

How do home-area energy storage devices work?

In the proposed approach, the operation of home-area energy storage devices is jointly conducted by end customers and network operators. The purpose is to fight for an optimal balance between DRs to energy price and to network congestion, and thus to maximize benefits for both consumers and network operators.
