

How can energy storage transform the global economy?

Energy storage has the potential to transform the global economy by making power load management more efficient, by providing a reliable energy supply, by boosting economic growth in the developing world, and by helping to level the playing field for renewable energy sources and distributed power.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Do electricity storage systems have economic perspectives?

The major result is that the perspectives of electricity storage systems from an economic viewpoint are highly dependent on the storage's operation time, the nature of the overall system, availability of other flexibility options, and sector coupling.

Why is energy storage important?

Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility. Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Can energy storage be economically viable?

We also consider the impact of a CO₂ tax of up to \$200 per ton. Our analysis of the cost reductions that are necessary to make energy storage economically viable expands upon the work of Braff et al. 20, who examine the combined use of energy storage with wind and solar generation assuming small marginal penetrations of these technologies.

Does energy storage allow for deep decarbonization of electricity production?

Our study extends the existing literature by evaluating the role of energy storage in allowing for deep decarbonization of electricity production through the use of weather-dependent renewable resources (i.e., wind and solar).
