

What is sustained emergency lighting?

Sustained Emergency Lighting Sustained emergency lighting combines elements of both maintained and non-maintained systems. It provides continuous lighting in specific areas while only activating emergency lighting in other zones when needed. This approach balances energy consumption and safety requirements.

How do emergency lighting fixtures work?

Maintained emergency lighting fixtures operate continuously alongside regular lighting systems. They can be manually switched to emergency mode or activate automatically when the main power fails. This type is commonly used in buildings where maintaining illumination is essential, such as hospitals and laboratories. 2.

How do emergency lighting distribution systems work?

Emergency lighting distribution systems must be designed to provide adequate power to supply light fixtures that can maintain at least minimum lighting requirements in a space, as specified by the code in footcandles (fc) or lux. The ratings of distribution equipment selected is a function of light fixture efficacy.

When should an emergency lighting system be automatically initiated?

The emergency lighting system must be automatically initiated upon any of the following three conditions: Manual or accidental opening of a lighting switch. The first two conditions are generally met through the use of an automatic transfer switch or emergency lighting inverter.

How long does emergency lighting last?

For emergency lighting in hazardous (Ex) environments, Eaton's Crouse-Hinds series ExLin V-CG-S LED fitting combined with Eaton's CEAG central battery system is the ideal solution. The required duration of emergency lighting in most Ex applications is at least 60 minutes, and this can be achieved using two different approaches.

Do emergency lighting systems need a backup power source?

To ensure the reliability of emergency lighting systems, backup power sources are crucial. Common backup sources include batteries, generators, and uninterruptible power supplies (UPS). These power sources must have enough capacity to sustain emergency lighting for an extended period until power is restored or evacuation is completed.
