What is the frequency regulation control framework for battery energy storage?

(3) The frequency regulation control framework for battery energy storage combined with thermal power units is constructed to improve the frequency response of new power systems including energy storage systems. The remainder of this paper is organized as follows.

Does battery energy storage participate in system frequency regulation?

Combining the characteristics of slow response, stable power increase of thermal power units, and fast response of battery energy storage, this paper proposes a strategy for battery energy storage to participate in system frequency regulation together with thermal power units.

Does energy storage regulate system frequency?

Energy storage, like wind turbines, has the potential to regulate system frequency via extra differential droop control. According to Ref. [1], the shifting relationship between the energy reserve of energy storage and the kinetic energy of the rotor of a synchronous generator defines the virtual inertia of energy storage.

Can large-scale battery energy storage systems participate in system frequency regulation?

In the end, a control framework for large-scale battery energy storage systems jointly with thermal power units to participate in system frequency regulation is constructed, and the proposed frequency regulation strategy is studied and analyzed in the EPRI-36 node model.

Is there a fast frequency regulation strategy for battery energy storage?

The fuzzy theory approach was used to study the frequency regulation strategy of battery energy storage in the literature [2], and an economic efficiency model for frequency regulation of battery energy storage was also established. Literature [3] proposes a method for fast frequency regulation of battery based on the amplitude phase-locked loop.

What is frequency regulation in power system?

Frequency regulation in power system In power systems, frequency is the continuously changing variable which is influenced by the power generation and demand. A generation deficit results in frequency reduction while surplus generation causes an increase in the frequency.
