## Can water-based hydrokinetic systems harness energy?

Energy harnessing from hydrokinetic systems has been explored over several centuries. With advancements in the technology in last decade, and the intermittent nature of other technologies for energy harvesting, interest in harnessing energy from water-based hydrokinetic systems has amplified.

What is energy harnessing based on a free-flowing water stream?

As a result, energy harnessing based on, e.g., free-flowing water streams, i.e., the hydrokinetic systems, are promising for the delivery of clean, safe and sustainable energy, especially in remote areas that do not have access to grid power.

What is a non-turbine energy harvesting system?

According to Wang et al. (2020),a non-turbine system based on flow induced vibration(FIV) energy harvesting can be classified into four categories such as vortex-induced vibration (VIV),buffeting,galloping,and flutter. The VIVACE converter utilises VIV,galloping,and flow-induced motions (FIM) as shown in Fig. 9 (c).

What is thermal energy storage?

Thermal energy storage is used particularly in buildings and industrial processes. It involves storing excess energy- typically surplus energy from renewable sources, or waste heat - to be used later for heating, cooling or power generation. Liquids - such as water - or solid material - such as sand or rocks - can store thermal energy.

How can hydrokinetic technology reduce mechanical stress and fatigue?

The turbine design and the use of a control strategy, such as maximum power point tracking (MPPT), pitch control and robust control, are important for reducing the mechanical stress and fatigue due to turbulent effects in harsh marine environments. 2.2. Structure of hydrokinetic technology
