

What is a solid-state high voltage high repetitive pulse generator?

Solid-state high voltage high repetitive pulse generators have a broad prospect in various applications. The high power and high-frequency operation of the pulse generator suffer from the massive heat dissipation problem, which limits the improvement of the output parameters and even affects the lifetime.

How does Ren's generator boost the output voltage?

Ren's generator effectively boosts the output voltage by using inductive energy storage as well as capacitive energy storage. However, it requires many inductors. Zhang et al. designed a high gain Marx generator in combination with a Cockcroft-Walton voltage multiplier.

How to supply high voltage from low voltage DC power supplies?

Among others, to supply high voltage from low voltage dc power supplies, many researchers have been working on the realization of solid-state Marx generators with high voltage gains. Wu et al. developed a bipolar Marx generator based on double transformers. By using positive and negative outputs, Wu's generator can realize high gain.

Can high voltage repetitive pulse generators generate pulsed discharge plasma?

Applying high voltage repetitive pulse generators (HVRPGs) to generate pulsed discharge plasma in various industrial applications is one of the most promising and active research fields.

How does a high voltage pulse generation circuit work?

High-voltage pulse generation circuit based on resonant circuit with saturable transformer. Supposing C_1 initially charged to U_{dc} , the energy in C_1 is resonantly transferred to C_2 , by closing switch S at $t = 0$, through L_1 and the transformer ST , where diode D provides the charging loop of C_2 , as seen in Fig. 14 (Choi 2010) (Li et al. 2005).

What is the power efficiency of a six times voltage gain circuit?

In the case of six times voltage gain, the component count of the proposed circuit is half that of the traditional Marx generator. Furthermore, in the experimental demonstration, the prototype of the proposed circuit achieves 81 % power efficiency with six times gain.
