

What is a wireless humidity sensor?

The wireless humidity sensor exhibits a sensitivity of 1.26 kHz/%RH, fast response speed, and excellent linearity, demonstrating its great application potential of the self-powered technology.

What is the performance of a humidity sensor?

Performance of a humidity sensor is measured by its detection range. Magnesium oxide (MgO) humidity sensor designed with micro-arc oxidation (MAO) technology gave better performance than semiconductor humidity sensors which are usually prone to narrow detection ranges and poor sensitivities for detection.

How self-powered wireless humidity monitoring system is based on ECH sensor?

To verify the self-powered characteristics of the ECH sensor, we conceptualized and designed a self-powered wireless humidity monitoring system based on ECH sensor, which is mainly composed of ECH sensor array, energy storage element, system circuit (signal reading module) and mobile APP (Fig. 1 b).

What are humidity sensors used for?

Each of these humidity sensors have peculiar applications which depend on the design and suitability for a given environment. Humidity sensors are electronic equipments that can be used to measure humidity in any given environment. Being electronic devices, they transform information to equivalent electrical signal.

Are humidity sensors capacitive or resistive?

Some of these humidity sensors can neither be fully classified as belonging to either the capacitive or resistive humidity sensors because they make use of combined effects of capacitance and impedance in sensing the humidity of environment. Example of this is the humidity sensor based on two dimensional molybdenum diselenide (MoSe<sub>2</sub>).

How is humidity measured in resistive sensors?

The humidity measurement in resistive sensors is based on the change in resistance or conductivity of a humidity-sensitive film produced by contact with water vapor.
