

Why do energy storage systems need special fuse inserts?

More energy storage systems are installed globally every day. Present-day battery systems often reach power outputs of several hundred MWh. That requires advanced protection using special fuse inserts. They have to dramatically reduce the current in response to a short circuit and interrupt it very quickly as well.

What is a SIBA energy storage system fuses?

SIBA's Energy Storage System (ESS) fuses are specifically designed and tested for the stringent requirements of ESS applications and are utilized by large OEM's globally.

Why do batteries need fuses?

Modern-day battery and energy storage systems place huge demands on fuses. Constantly rising power levels at maximum DC voltages of 1500 V can generate short-circuit currents of several hundred kiloamperes. Another issue relates to load profiles produced by a wide variety of loading and unloading cycles.

How big is the energy storage industry?

The energy storage industry is poised to expand dramatically, with some forecasts predicting that the global energy storage market will exceed 300 gigawatt-hours and 125 gigawatts of capacity by 2030. Those same forecasts estimate that investments in energy storage will grow to \$103 billion over that period.

Which fuses are best for DC ESS applications?

A wide range of fuses are available to handle a variety of current overload applications. High-speed fuses are the usual choice for these DC ESS applications because they are much smaller, faster and less expensive than DC circuit breakers. The maximum interrupting rating for circuit breakers tops out at about 25,000 to 30,000 amps.

What is a Littelfuse PSR fuses used for?

Figure 1. Littelfuse PSR Series High-Speed Square-Body Fuses are frequently used for overcurrent protection of inverters because of their compact design, fast response to short circuit fault currents, and high interrupting ratings. These fuses are also invaluable for protecting a BESS's DC batteries.
