

How does a backup switch work?

It plugs into your meter socket, with the meter plugging directly into the Backup Switch. Within the Backup Switch housing, the contactor controls your system's connection to the grid. The built-in consumption meter provides energy usage monitoring, providing you with precise, real-time data of your home's energy consumption.

What is Enphase enpowertm smart switch?

Enphase Enpower™ smart switch connects the home to grid power, the Encharge storage system, and PV. It provides microgrid interconnect device (MID) functionality by automatically detecting and seamlessly transitioning the system from grid power to backup power in the event of a grid failure.

Can the Encharge storage system be added to an existing system?

The Encharge storage system can be added to an existing system without using an Enpower smart switch, however, it will not provide backup power. When installed in this configuration, the Encharge storage system is treated as a distributed energy resource (DER), equivalent to a PV system, and cannot form an intentional island.

How does the Encharge storage system work?

There are two common configurations that allow the Encharge storage system to provide power to customer loads independent of the grid. In the whole home (main load panel) backup configuration, Enpower smart switch is installed on the line-side of the main load panels rated up to 200A.

Can Enpower smart switch be installed on a service equipment disconnect?

When Enpower smart switch is installed on the load side of the service equipment disconnect means, main and load breakers may not need to be installed in the Enpower. For example, an Enpower smart switch is installed with total of 40 A of DER over current protection and that is back feeding a 200 A main breaker load center.

What is a whole home backup switch?

Whole Home Backup by Design: Backup Switch is designed to be easily installed in your home's existing meter socket and to safely disconnect your home during grid outages.
