

What are air cooled condensing units?

The basic design schemes of air-cooled condensing units (ACCs), their classification, and specific features of their layout solutions are presented. The important structural components, including a large-diameter steam line, fans, and heat-exchanging modules, are described. The basic requirements for the ACC's fan units are formulated.

Is AC condensate suitable for energy recovery systems?

The evaluation of the thermal quality of AC condensate is recognized as a prerequisite for energy recovery applications. This research will offer valuable insights on techniques to improve the thermal quality of AC condensate which enhances its suitability for energy recovery systems.

How does a condensate assisted Pre-cooling unit improve indoor air quality?

A pre-cooling unit was developed, utilizing a sensible and latent heat storage system to recover energy from the condensate and pre-cool the ambient air(170 m<sup>3</sup> /h) for improved indoor air quality. The layout of condensate assisted pre-cooling unit, and drop in air temperature distribution is illustrated in Fig. 8 (a).

What are the applications of energy storage systems?

The application for energy storage systems varies by industry, and can include district cooling, data centers, combustion turbine plants, and the use of hot water TES systems. Utilities structure their rates for electrical power to coincide with their need to reduce loads during peak periods.

What is cold thermal energy storage (CTEs)?

Cold thermal energy storage (CTES) technology has received increased interest for the past two decades from researchers and stakeholders in the refrigeration sector as a measure to reduce the peaks in the cooling load that occurs in many refrigeration systems, e.g. in food processing plants and air-conditioning systems.

Are condensate-assisted thermal energy storage systems sustainable?

Condensate-assisted thermal energy storage systems offer energy-saving. Bridging research gaps in condensate utilization supports sustainability. Recovery and reuse of condensate generated from the air conditioner are studied extensively for building a sustainable environment.
