

What is the difference between a storage system and air conditioning system?

Capital costs incurred are comparable to conventional air-conditioning system, with cost saved by using a small refrigeration plant. Storage systems let chillers operate at full load all night instead of operating at full or part load during the day.

Does a building air conditioning system work at 100% capacity?

Realistically, no building air conditioning system operates at 100% capacity for the entire daily cooling cycle. Air conditioning loads peak in the afternoon -- generally from 2 to 4 PM -- when ambient temperatures are highest, which put an increased demand for cooling and electricity.

What is thermal energy storage for space cooling?

Thermal Energy Storage (TES) for space cooling, also known as cool storage, chill storage, or cool thermal storage, is a cost saving technique for allowing energy-intensive, electrically driven cooling equipment to be predominantly operated during off-peak hours when electricity rates are lower.

Does cool storage reduce energy consumption?

Cool storage will reduce the average cost of energy consumed and can potentially reduce the energy consumption and initial capital cost of a cooling system compared to a conventional cooling system without cool storage.

Why is a cool storage system so expensive?

The cooling load is too small to justify the expense of a storage system. Typically, a peak load of 100 tons or more has been necessary for cool storage to be feasible. The design team lacks experience or funding to conduct a thorough design process.

How much does ice thermal storage cost?

Ice thermal storage requires some additional components such as the ice thermal storage units, ethylene glycol, heat exchanger, and concrete slab, which total \$137,600.
