

What is a passive charge balancing system?

The resistive method is called passive, and the capacitive or inductive methods are called active charge balancing systems. The passive method removes excess energy of the higher voltage cell using heat dissipation on the resistors or MOSFETs as a load. The active balancing circuit equalizes the battery cells at an average level.

How does passive balancing work?

Passive balancing generally connects resistors in parallel at both ends of the battery cell, converts electrical energy into heat energy and consumes it in the form of resistor and performs balancing based on the battery cell with the lowest SOC in the battery pack [10]. This means that there is no energy distribution between battery cells.

Can passive and active cell balancing improve EV battery range?

Consequently, the authors review the passive and active cell balancing method based on voltage and SoC as a balancing criterion to determine which technique can be used to reduce the inconsistencies among cells in the battery pack to enhance the usable capacity thus driving range of the EVs.

What is the difference between passive and Active balancing?

In the passive balancing method, Q1_N must maintain continuous transmission to charge the battery. On the other hand, in the active balancing method, Q1_N obtains the turnoff position and ensures that the battery leaves the charging system when the battery cell reaches the desired fullness ratio.

What is active battery balancing?

Active battery balancing uses the energy shuttle of capacitance or inductance to transfer the energy in the high SOC battery to the low SOC battery and redistributes the energy by designing a specific energy converter.

What are passive and active cell balancing methods?

It is classified as passive and active cell balancing methods based on cell voltage and state of charge (SOC). The passive cell balancing technique equalizes the SOC of the cells by the dissipation of energy from higher SOC cells and formulates all the cells with similar SOC equivalent to the lowest level cell SOC.
