Phase-change materials (PCMs), such as salt hydrates 1, metal alloys 2, or organics 3, store thermal energy in the form of latent heat, above their phase-transition temperature, which is...

The use of phase change material (PCM) is being formulated in a variety of areas such as heating as well as cooling of household, refrigerators [9], solar energy plants [10], ...

A potential route to achieving such a goal involves cooling energy storage during low demand and releasing the stored cooling at peak demand times via thermal energy storage (TES). Latent heat thermal energy ...

Furthermore, they have high latent heat, good nucleation properties, low liquid phase sub-cooling capability, and minimal volume variation. Finally, they are compatible with most of the construction materials, they can ...

Thermal storage is very relevant for technologies that make thermal use of solar energy, as well as energy savings in buildings. Phase change materials (PCMs) are positioned ...
