

Energy storage policy for thermal power plants

Can thermal storage power plants achieve 100 % renewable power supply?

The paper at hand presents a new approach to achieve 100 % renewable power supply introducing Thermal Storage Power Plants (TSPP) that integrate firm power capacity from biofuels with variable renewable electricity converted to flexible power via integrated thermal energy storage.

Why do we need thermal power plants in the EU?

The energy system in the EU requires today as well as towards 2030 to 2050 significant amounts of thermal power plants in combination with the continuously increasing share of Renewables Energy Sources (RES) to assure the grid stability and to secure electricity supply as well as to provide heat.

What are thermal energy storage technologies?

How about in a tray of ice cubes? Thermal energy storage technologies allow us to temporarily reserve energy produced in the form of heat or cold for use at a different time. Take for example modern solar thermal power plants, which produce all of their energy when the sun is shining during the day.

What is thermal storage power plant (TSPP)?

Thermal Storage Power Plants (TSPP) that integrate solar- and bioenergy are proposed for that purpose. Finally, in the third phase, renewable power supply can be extended to other sectors via power-to-X technologies, reducing fossil fuel consumption for transport, heat and industrial purposes.

Which energy storage technologies are used in a flexible thermal plant?

Among energy storage technologies and their significant differences on installed capacity and time response [7,8], in the following chapters, three different technologies are investigated in combination with flexible thermal plants: LAES, Batteries, Power to Fuel with a focus on Power to Methanol (PtM).

Why is thermal energy storage important?

Thermal energy storage (TES) can help to integrate high shares of renewable energy in power generation, industry and buildings. This outlook identifies priorities for research and development. Transforming the global energy system in line with global climate and sustainability goals calls for rapid uptake of renewables for all kinds of energy use.
