What permitting regimes apply to battery energy storage projects?

There are three distinct permitting regimes that apply in developing battery energy storage projects, depending upon the owner, developer, and location of the project. The increasing mandates and incentives for the rapid deployment of energy storage are resulting in a boom in the deployment of utility-scale battery energy storage systems (BESS).

How do energy storage systems charge?

Energy storage systems can charge from a wide range of sources. This guidebook is focused on commercially available small-scale systems. At this time, these systems are mainly composed of battery-based storage connected to the electrical grid and to local sources of power such as solar photovoltaic panels.

What is the energy storage permitting guidebook?

The goal is to develop an Energy Storage Permitting Guidebook that outlines best practices and proposes a standard process for permitting energy storage systems of less than 1 megawatt. Simplifying and standardizing permitting procedures for new storage systems will have benefits for authorities having jurisdiction (AHJs), installers and consumers.

How does energy storage work in California?

Energy storage systems can charge from the grid when utility rates are low, and then send power back to local circuits when utility rates are high or to supply emergency power. The State of California is evolving building codes and incentive programs to accelerate the use of energy storage.

How much will energy storage cost in 2022?

A recent GTM Research report estimates that the price of energy storage systems will fall 8 percent annually through 2022. There are many different ways of storing energy, each with their strengths and weaknesses. The list below focuses on technologies that can currently provide large storage capacities (of at least 20 MW).

What are battery storage projects?

Most of the battery storage projects that ISOs/RTOs develop are for short-term energy storage and are not built to replace the traditional grid. Most of these facilities use lithium-ion batteries, which provide enough energy to shore up the local grid for approximately four hours or less.
