Can a new energy storage traction power supply system improve regenerative braking energy utilisation?

To solve the negative sequence (NS) problem and enhance the regenerative braking energy (RBE) utilisation in an electrified railway, a novel energy storage traction power supply system (ESTPSS) is proposed in this study.

What are energy storage devices used for?

Energy storage devices can be used for uninterruptible power supply (UPS), transmission and distribution (T&D) system support, or large-scale generation, depending on the technology applied and on storage capacity.

What are energy storage technologies based on fundamental principles?

Summary of various energy storage technologies based on fundamental principles, including their operational perimeter and maturity, used for grid applications. References is not available for this document.

Can energy storage systems be used in electrified railways?

Currently, as the key technology of smart grids and distributed generation, energy storage systems (ESSs) have attracted worldwide attention [24,25]. The ESS can play a vital role in power demand-side management and load shifting. Moreover, the potential of an ESS in electrified railways has been widely discussed.
