

What is inertia in power systems?

Inertia in power systems refers to the energy stored in large rotating generators and some industrial motors, which gives them the tendency to remain rotating. This stored energy can be particularly valuable when a large power plant fails, as it can temporarily make up for the power lost from the failed generator.

How can energy storage systems simulate essential inertia?

An Energy storage system with the power-electronics converter and the right control algorithm can be used to create virtual inertia to simulate the essential inertia. Fig. 3 illustrates an interpretation of this idea in the frequency response. In Refs. [177,178] provide more information on internal virtual controls.

Does a utility-scale battery energy storage system provide inertia support?

As a result, the power system is prone to frequency instability in the event of a sudden load/generator contingency. Utility-scale battery energy storage system (BESS) could provide additional inertia response support in the power system. In this work, a methodology is proposed for the sizing of BESS for inertia support.

Why is inertia important in the power grid?

Historically, in the U.S. power grid, inertia from conventional fossil, nuclear, and hydropower generators was abundant--and thus taken for granted in the planning and operations of the system.

Why is inertia important?

Grid frequency, which is a measure of the balance of supply of electricity and demand, can drop if a large power plant or transmission fails. Inertia resists this drop in frequency, giving the grid time to rebalance supply and demand. Inertia is only one of several grid services that help maintain power system reliability.

Why do we need energy storage systems?

Additionally, energy storage systems enable better frequency regulation by providing instantaneous power injection or absorption, thereby maintaining grid stability. Moreover, these systems facilitate the effective management of power fluctuations and enable the integration of a higher share of wind power into the grid.
