

What would be a good source of energy for a spaceship?

Another big thing for large (solar system) scale energy production would be hydrogen extraction from gas giants for large-scale fusion reactors. This would probably be your main source of fuel for spaceships and energy production outside of planetary gravity wells.

Is the transition from science fiction to reality happening?

The transition from science fiction to reality is happening before our very eyes, as groundbreaking advancements like Neutrino Energy and Neutrinovoltaic technology push the boundaries of what is possible in the realm of renewable energy.

What are some esoteric things that rely on made-up physics?

Beyond that there's more esoteric stuff that relies entirely on made-up physics, like siphoning energy out of other dimensions, or doing some weird energy extraction with quantum vacuum, or perpetual motion machines with wormholes and crazy stuff like that.

How can a sci-fi world become more efficient?

Especially solar power can go a long way in becoming more efficient. Even fossil fuels can be an option if easily accessible, though a sci-fi world might find it wasteful to burn them instead of turning them into versatile and useful plastic goods, if they even do that. Fusion energy Dyson sphere/swarm Neutron star battery

Could science fiction be planetary in scale?

Science fiction could go further: being planetary in scale, it could show how a civilization lived within its biosphere--its most fundamental home. Dusky Basin looked like a still-evolving world. Gray-brown mountains in the distance could have been captured by the Curiosity rover; below them, a granite landscape was spotted with grass and flowers.

Are fossil fuels a good option for a sci-fi world?
