

Which materials can be used in wearable fabric energy storage?

Other reported materials such as the poly (3,4-ethylenedioxythiophene) polystyrene sulfonate (PEDOT:PSS), 84 CNF, 96 and AgNW composite fiber, 64 also showed great potential in wearable fabric energy storage. These materials possess high stability, excellent mechanical properties and high electrical conductivity. 123,143

What are the advantages of fabric energy storage devices?

Attributed to the inherent excellent mechanical reliability and flexibility of the yarn-shaped or fiber-shaped fabric energy storage devices, it could withstand large mechanical deformations. Even if it is treated by weaving, sewing, cutting, etc., it will not have an excessive impact on the performance of the textile-based energy storage device.

Can conductive polymers be used in fiber/yarn-shaped energy storage devices?

Due to the excellent energy storage capacity of transition metal oxides and conductive polymers, they are widely used in fiber/yarn-shaped energy storage devices to improve the performance of yarn MSCs and MBs. Wang et al.⁸⁴ loaded poly (3,4-ethylenedioxythiophene)-poly- (styrene sulfonate) (PEDOT:PSS) on carbon nanofiber (CNF)-coated CF bundle.

Can MXene/polyurethane composite fibers be used for strain sensors?

Herein, Seyedin et al.¹²⁰ utilized a scalable wet-spinning technique to produce MXene/polyurethane (PU) composite fibers with superior stretchability and conductivity (Fig. 7a), which can be further applied to strain sensors.

What is energy density in energy storage devices?

Energy density is a core parameter of minimized energy storage devices, which is related to the energy storage mechanism. MB is regarded as the primary choice for minimized powering source due to its adequate energy density and stable voltage output.

What is the capacitance of conductive polymers in fiber/yarn-shaped energy storage devices?

When the length was 50 cm, there was a high capacitance of 1164 mF. Due to the excellent energy storage capacity of transition metal oxides and conductive polymers, they are widely used in fiber/yarn-shaped energy storage devices to improve the performance of yarn MSCs and MBs.
