

How to improve energy storage performance of RFEs?

Considerable efforts have been devoted to improving the energy storage performance of RFEs through designing the domain structure 3, 6, 19, defects types 4, 20, strain and interface state of the film 21, 22, 23, 24, 25, or selecting suitable material to construct composite dielectrics 10, 26.

Why are aqueous electrochemical energy storage devices limited?

Aqueous electrochemical energy storage devices are always limited in the inherited weaknesses of water, such as narrow operation temperature range and electrochemical stability window (ESW).

What is the thermal stability of energy-storage performance?

We then measured the thermal stability of the energy-storage performance in the range of -55°C to 100°C (Fig. 4E and fig. S20). The MLCCs show good performance stability at an electric field of 500 and 700 kV cm^{-1} with degradation below $\sim 10\%$ for U_e and i over the entire measurement temperature range.

How is energy-storage performance calculated?

An overall estimation of energy-storage performance, calculated as $UF = U_e / (1 - i)$ (34), reached a high value of 153.8 owing to the combined high U_e and ultrahigh i .

How do we evaluate the energy-storage performance of ceramics?

To evaluate the overall energy-storage performance of these ceramics, we measured the unipolar $P - E$ loop of these ceramics at their characteristic breakdown strength (Fig. 3E and fig. S13) and calculated the discharged energy densities U_e and energy-storage efficiency i (Fig. 3F and fig. S14).
