

How do I choose a tank seal?

Resilient seals typically offer better performance since they create a tighter seal. When choosing a seal, consider: Tank dimensions and roof type: Seals must properly fit your tank and work with either an internal or external floating roof. Product stored: Seals need to be chemically compatible with the specific liquid contents.

Do floating roof storage tanks need a perimeter seal?

Literally thousands of tons of VOC vapors escape through floating roof perimeter seals each year according to the U.S. Environmental Protection Agency. For this reason, it is imperative that you select the proper perimeter seal for your floating roof storage tanks.

How do I choose a seal for my Floating roof tank?

Taking the time to understand the options and choose wisely will benefit both your business and the environment. When choosing a seal for your external and internal floating roof tank, you have two main options: mechanical shoe seals or low profile secondary seals.

Do floating roof tanks need a primary seal?

A primary seal should be considered for all floating roof tanks, and listed below are a variety of choices. Mechanical shoe seals and resilient filled seals (i.e. liquid-filled tube seals and foam log seals) are the two main primary seal types.

What is the SealMaster® floating roof seal system?

The SealMaster® floating roof seal system was developed over 25 years ago with the goal of making a seal that adjusts to the irregularities of tanks while remaining gas tight and virtually maintenance free. The solution is the SealMaster® seal system.

Do you need a secondary seal on a floating roof?

Secondary Seals are normally required for external floating roof tanks, and may or may not be required when an external roof covers the floating roof. However, some localities require a secondary seal on a covered floating roof if the primary seal is a vapor mounted seal.
